

Scottish Macro Moth List - February 2009, Version 1

This list aims to include every species of macro-moth reliably recorded from Scotland, together with an assessment of its Scottish as opposed to UK status, as guidance for observers contributing to the NMRS. It should be regarded as provisional and erring on the side of caution.

At one time or another, virtually every macro-moth on the British list has been reported from Scotland. However, many of these are almost certainly misidentifications or other errors, including name confusion. A modern complication involves the unwitting transport of nonnative species inside the traps of visiting observers, which are then included in the next night's catch. Thus species considered highly improbable have been ignored. They include 19th century records of Speckled Beauty *Fajivorina arenaria* and Waved Black *Parascotia fuliginaria* from Perthshire and modern records of Portland Ribbon Wave *Idaea degeneraria* and Scarce Wormwood *Cucullia artemesia* from the Isle of Skye, among many similar instances. Old or unconfirmed records that seem more plausible have been relegated to an appendix. It is likely that some of these species will be promoted to the main list when further evidence comes to light.

Assessments of Scottish status should be considered as provisional, subjective, and at times no more than a guess, particularly when followed by a question mark. This is especially true of the Geometridae, as distribution maps have never been published for most of this family.

Also, the status of our moths is changing rapidly at present, with species expanding northwards in response to climate change. Scotland has gained many new colonists in the last decade, while some resident species have undergone spectacular increases in range.

Geographical terms used in this list are very broad; for instance S means south of the River Tay, while E and W divide the country roughly in two. Note that UK designations such as Na and RDB still apply, though they have not been repeated. Ironically, perhaps the rarest moths in Scotland are not its celebrated Highland specialities but more southern species with just a foothold in the country. Currently, Shuttle-shaped Dart *Agrotis puta* is almost certainly scarcer than Cousin German *Protolampra sobrina*.

The list and status assessments will be updated regularly as NMRS data increase or clarify our knowledge of Scottish moths. In the meantime, observers are encouraged to point out any errors or omissions and to suggest amendments. Candidate species for admission to the Scottish list should be supported by definite evidence such as a specimen or photograph.

A large number of observers, internet forums and record centres have contributed either directly or indirectly to the creation of this list. We are grateful to them all.

APPENDIX: PLAUSIBLE ADDITIONS

This section contains historical records of additional species that seem plausible but cannot now be confirmed. It also includes more recent records that that may well be genuine but are not considered proven beyond reasonable doubt at the time this list was compiled. Almost certainly, some of these species will be upgraded to the main list when firm evidence is available.
